## Mechanical data

# System connections

Connectors:

-  **Power and Logic supplies are not isolated but they have common reference inside the drive.**
-  **Use two separate and isolated supply for logic and digital outputs.**
-  **Connect GND of the logic supply and VSS of the output supply to PE near to the origin of the supplies with two different wires.**
-  **Do not connect simultaneously PE to the secondary circuit of the power transformer and to GND of the logic supply, otherwise the drive breaks and becomes unusable.**

## Service SCI connection

This connection is **only** possible with hardware and software provided by Ever.  
Kit code: SW4\_SERV00-SL or SW4-SERV00-EE.

## Absolute Encoder interface connection

Electrically NOT-isolated 5V RS485 Full-Duplex interface

Maximum supply current 100 mA.

**GND is internally in common with power ground, this is potentially dangerous. Take all necessary measures to avoid possible contacts in the final installation.**

## Digital inputs connection

Differential PNP, NPN and Line Driver type.

### 3.3 - 24V INPUT

### 2 - 24V INPUT

## Verify the installation

- Check all connection: power supply and inputs/outputs.
- Make sure all settings right for the application.
- Make sure the power supply is suitable for the drive.
- If possible, remove the load from the motor shaft to avoid that wrong movements cause damage.
- Enable the current to the motor and verify the applied torque.
- Enable a movement of some steps and verify if the rotation direction is the desired one.
- Disconnect the power supply, connect the load on the motor and check the full functionality.

## Analysis of malfunctions

*When any of the following situations occur, the drive is placed in a fault condition.*

DEFECT	CAUSE	ACTION
Intervention of the thermal protection.	Can be caused by a heavy working cycle or a high current in the motor.	Improve the drive cooling by a natural or fan air flow. Consider to use a motor with a higher torque vs current rating.
Intervention of the current protection.	Short circuit on the motor powering stage(s) of the drive.	Check motor windings and cables to remove the short circuits replacing faulty cables or motor if necessary.
Intervention of the over/under voltage protection	Supply voltage out of range.	Check the value for the supply voltage.
Open phase motor protection.	Motor windings to drive not proper connection.	Check motor cables and connections to the drive.

*When any of the following situations occur, the drive doesn't work and isn't placed in an error condition.*

DEFECT	CAUSE	ACTION
Noisy motor movement with vibrations.	Can be caused by a lack of power supply to a phase of the motor or a poor regulation of the winding currents.	Check the cables and connections of the motor and/or change the motor speed to avoid a resonance region.
The external fuse on the power supply of the drive is burned.	Can be caused by a wrong connection of the power supply.	Connect the power supply correctly and replace the fuse.
At high speed, the motor torque is not enough.	Can be due to a 'self-limitation' of motor current and torque.	Increase the motor current (always within the limits), increase the supply voltage, change motor connection from series to parallel.
